light emitting fabrics

Textile push button

- Knitted three-layered fabric, two conductive layers with a non-conductive layer in between
-
- If pressed, the two conductive layers touch allowing current flow
- Materials: acrylic yarn, stainless steel

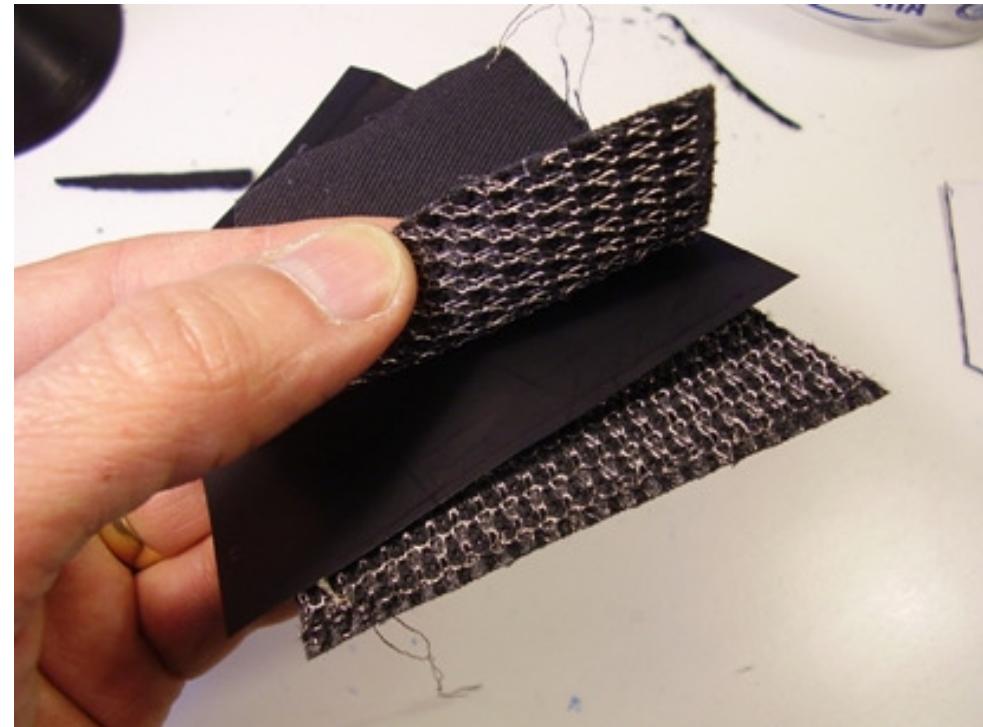

Innovative aspects

- › No need of further production steps
- › Low cost
- › Transpiring
- › Semi-transparent
- › Flexible
- › Different activating pressures
- › Matrix switches
- › Large area switches (50 cm x 50 cm)
- › Skin compatible materials
- › Switch arrays

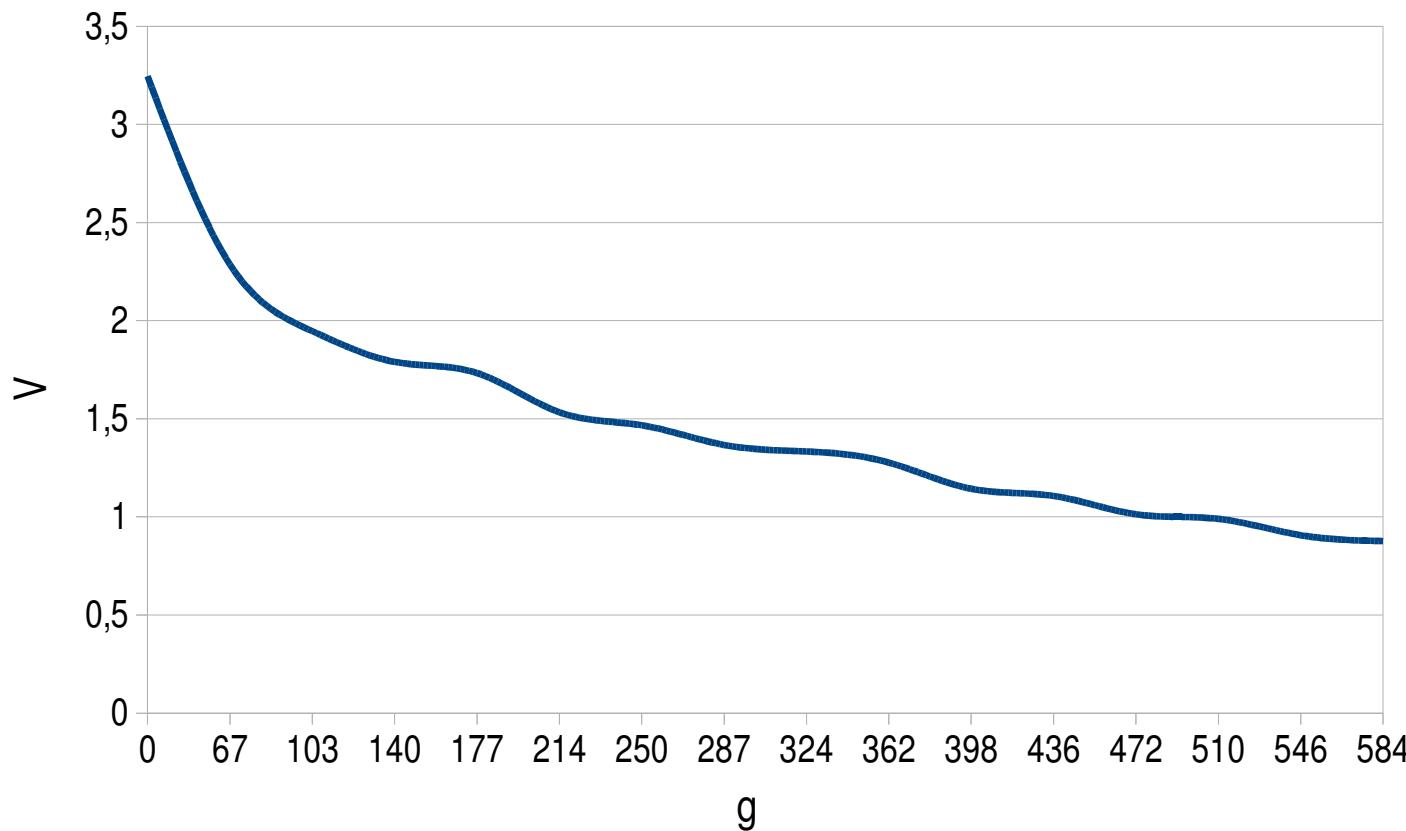

Textile sensors:

- » Resistive principle
- » Analog
- » Linear
- » Low hysteresis
- » Flexible
- » Easy to connect
- » They have a textile feel
- » Can be shaped
- » Can have large size

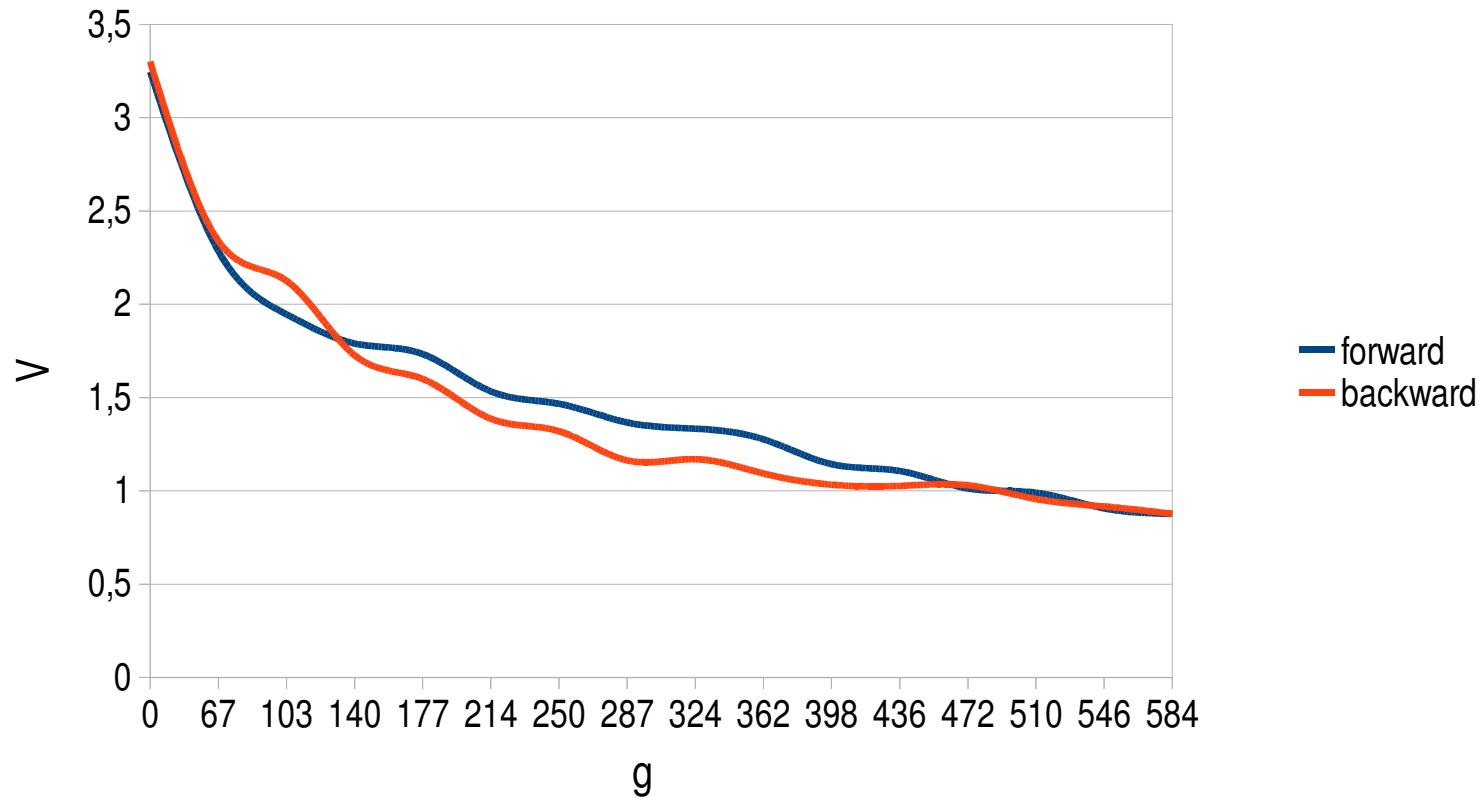

Textile sensors linearity (V versus g)*

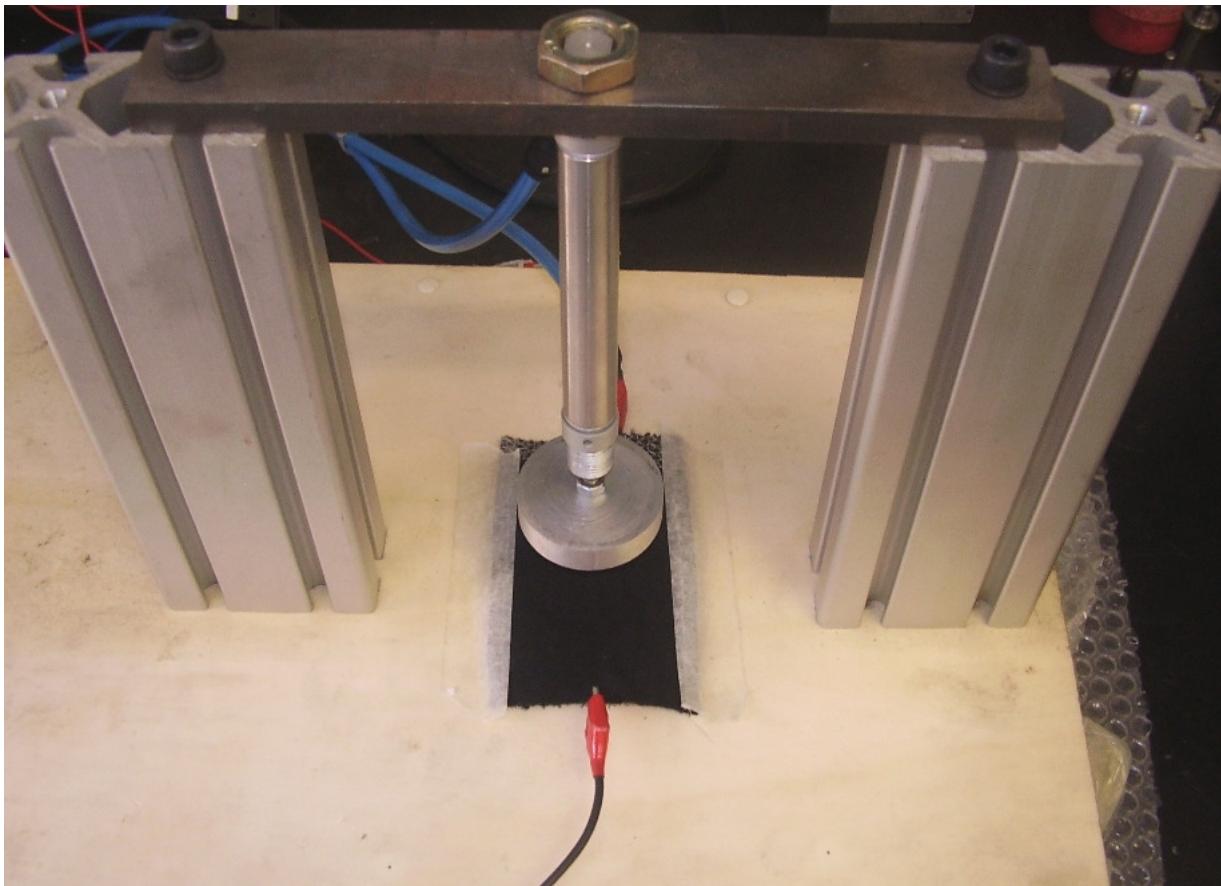

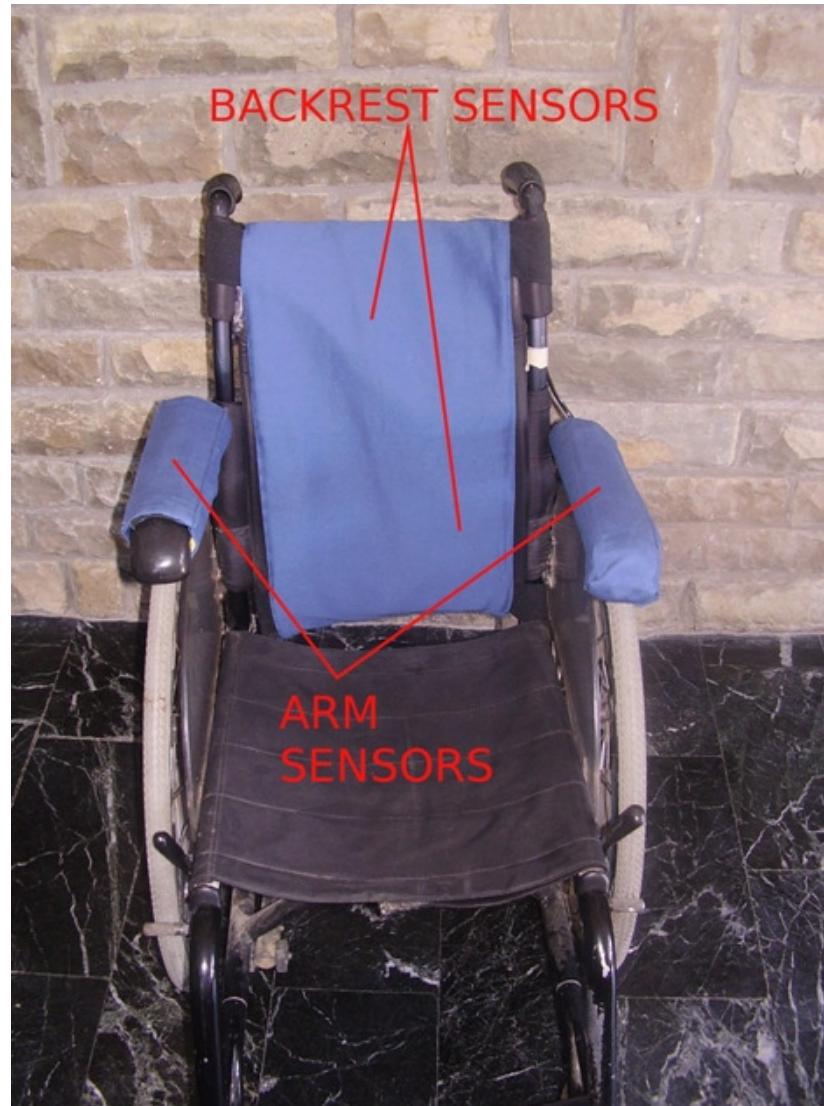

* pressure applied by a 50 mm diameter disk

Textile sensors hysteresis*

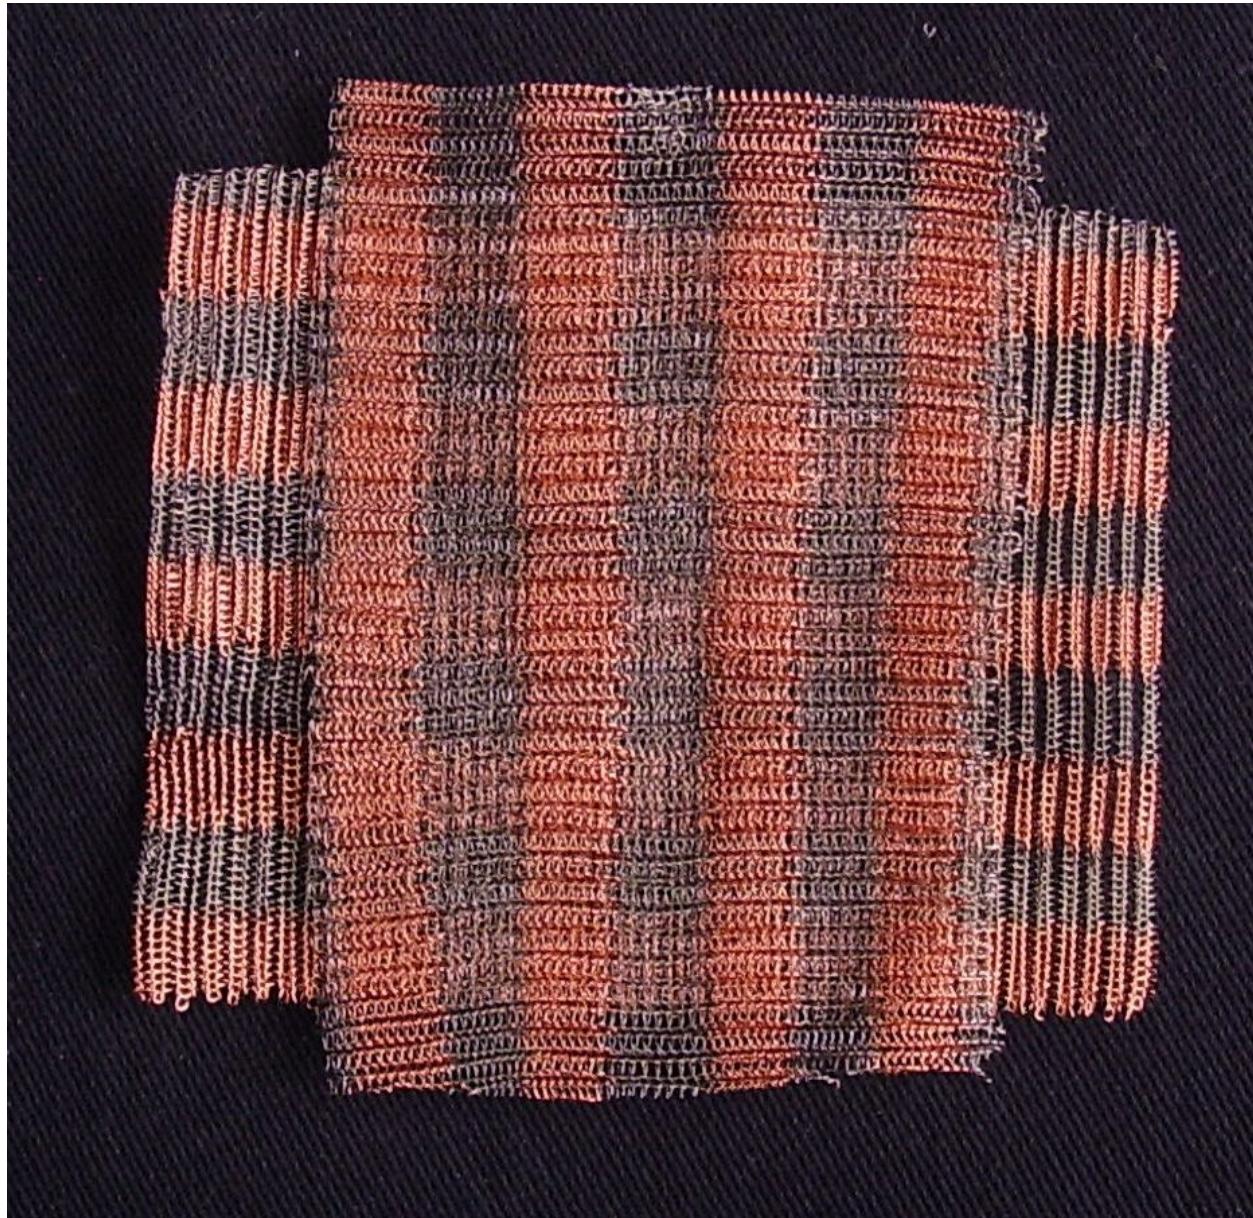

* pressure applied by a 50 mm diameter disk
